Director General of Health Services  
Government of India.

# NATIONAL SAVINGS CERTIFICATES

Are now available in three different series, maturing after 5, 7 and 12 years. The certificates yield 3%, 3½% and 4-1/6% simple interest respectively, at maturity. The 12 years certificates increase your money by 50% but if necessary can be encashed after 18 months (Rs. 5/- certificates after 12 months). The 5 and 7 years certificates can be encashed at any time.

National Savings Certificates are obtainable in denominations of 5, 10, 50, 100, 500, 1,000 and 5,000 and you can invest upto Rs. 15,000 in them (inclusive of any Post Office cash certificates held).

Full particulars obtainable from all post offices, District Organisers of the Small-Savings Scheme, Assistant National Savings Officers, Provincial National Savings Officers or the National Savings Commissioner, Simla.

**TODAY'S SAFEST AND MOST PROFITABLE INVESTMENT**

## REMARKS

The vital statistics returns for week ending the 3rd July, 1948 for towns with a population of 30,000 and over have been received in respect of only 173 towns (156 towns out of 182 in India and 17 towns out of 30 in Indian States). The estimated mid-year population of these 173 towns is 22,320, 192. Total births and deaths recorded in these towns numbered 11,640 and 7,968 representing birth and death rates of 27.1 and 18.6 per thousand of the population respectively.

(A) *India*:—The births and deaths recorded in towns of India were 10,703 and 7,310 giving birth and death rates of 27.1 and 18.5 per thousand of the population respectively. No town recorded a death rate of 50 or over per thousand of the population.

There were 145 deaths from cholera, 59 deaths from smallpox and one death from plague. The distribution of cholera deaths was as follows: Calcutta recorded 65; Howrah 18; South Suburban 15; Aloni 9; Madras 5; Lucknow 4; Bahraich and Banda 3 each; Hardwar Union, Ferozabad,

Bahrampur, Monghyr, Midnapur, Bhatpara, Madura and Vaniyambadi 2 each; Sitapur, Kanpur, Gorakhpur, Etawah, Hooghly, Chinsura, Nabadwip and Thuvannamalai one each. The towns that reported deaths from smallpox were Howrah and Calcutta 8 each; Banaras 6; Gaya 5; Amritsar, Lucknow, Gorakhpur, Ferozabad, Ranchi, Bhatpara, Nabadwip, Jabulpore, Akola, Ahmedabad and Beawar 2 each; Delhi City, Sitapur, Allahabad, Budaun, Monghyr, Bally, Bombay, Surat, Masulipatam and Ajmer one each. The one death from plague was recorded in Jaunpur.

(B) *Indian States*:—The births and deaths recorded in towns in Indian States were 937 and 658 representing birth and death rates of 26.8 and 18.8 per thousand of the population respectively. No town recorded a death rate of 50 or over per thousand of the population. In all, 5 deaths from smallpox were recorded, Mysore city reporting 2; Patiala city, Malekotla and Bhopal city one each. There was no death from cholera and plague during the week under review.

NEW DELHI, 3 (INDIA) }  
The 3rd August, 1948. }

K. C. K. E. RAJA,  
Director General of Health Services,  
Government of India.

## MINISTRY OF HOME AFFAIRS

In a country with defective vital statistics and a population in rapid change, the age-table could without exaggeration be said to be the most important of all census tables. Full enumeration was achieved in 1931 but only the bare minimum reached tabulation and the age table was not among them. But this minimum carried the important consequence that the entire body of slips had to be handled; and the Census Commissioner, Mr. Yeatts, took advantage of this to attempt to draw a random sample by directing his Provincial Census Superintendents to set aside every 50th slip. Thanks to this initiative it has now been possible to produce an age-table for a Province of India from that 1/50 sample or Y-sample as it is generally known in statistical circles.

2. Intermediate stages were the investigations by the Population Data Committee in 1945. This was a strong body with Mr. Yeatts as Chairman, and with Professor P. C. Mahalanobis, F.R.S., Professor K. B. Madhava, Sir T. E. Gregory and Dr. K. C. K. E. Raja as members. The Committee had the great advantage of counsel at one stage from Professor R. A. Fisher, F.R.S. Apart from a variety of other recommendations, the Committee pronounced the Y-Sample a valid base for population projections and age-table and life-table calculations. The Indian Statistical Institute was entrusted with the work of transferring the Y-sample to Hollerith Cards and of reconstruction thereon of certain standard tables left out of the 1941 census publications under the exigencies of the war, and of making certain studies in sampling techniques as applied to demographic problems. Work was greatly hampered by difficult conditions prevailing in Calcutta and Eastern India in 1946 and by the great changes that took place in 1947. But the Institute, under Professor Mahalanobis' distinguished direction, has grappled with and overcome these difficulties and the appearance of this table is an indication of their success.

3. A tribute must be paid to the major States of India which on the advice of the Census Commissioner proceeded to full tabulation despite the fact that in British India as it then was, only minimum tabulation, which excluded the age tables, was sanctioned. The existence of a full age record for Kashmir, Rajputana, Gwalior, Hyderabad, Mysore, Travancore, Cochin, meant that we had this background of full tabulation against which to test the sample.

4. The appearance of this table is a portion, for it presents a full age record for 21 million people on the basis of a sample of less than half a million. Provided modern methods of sampling are properly and strictly applied, the scope for similar simplifications is enormous, and it is one of the chief objectives of the Census Commissioner to increase the use of these methods.

5. It must be remembered that what we are presenting are the sample estimates and not the total counts, hence a liability to some degree of uncertainty due to errors of sampling and the circumstances of compilation. The magnitude of this 'uncertainty' though absolutely speaking larger in the larger estimates, becomes with increase in dimensions relatively less and less in comparison with the estimate itself. A rough idea of the order of this uncertainty can be obtained from the fact that a figure of the order of a thousand may be off in the third digit, one in lakhs in the fourth and so on.

6. The table speaks only in thousands, the last two digits having little significance in view of the uncertainties of estimation. The estimates in thousands may however be considered to be sufficiently accurate for all practical purposes. After all, what we require is only dimensions.

H. V. R. IYENGAR, Secy.

## TABLES BASED ON Y-SAMPLE, CENSUS OF INDIA 1941—WEST BENGAL

## INTRODUCTION

The Census tabulation of 1941 was cut short by the elimination of a number of useful tables. Even the age-tables were not prepared as a measure of retrenchment owing to the exigencies of the war. Fortunately, however, Mr. M. W. M. Yeatts, the Census Commissioner, issued instructions to preserve 2% of the original individual slips by drawing out every fiftieth slip after sex classification. In 1945 the Government of India approved of the proposal made by Prof. P. C. Mahalanobis to have the information contained in the 2% slips (called the Y-sample, extracted from the original slips) transferred to Hollerith punched cards and thus preserved in a reasonably permanent form. The Population Data Committee appointed by the Government of India in 1944 examined the matter and reached the conclusion that many of the omitted tables could be reconstructed on the basis of the Y-sample (Report of the Population Data Committee, Government of India, 1945, p. 16). The Indian Statistical Institute was entrusted with the work of transferring the information in the Y-slips to Hollerith cards and also with the construction of a number of useful tables. Some of the tables referring to the Province of West Bengal, constructed on the basis of the Y-sample, are given here.

In the fourth volume of the Report on the Census of India 1941, which deals with Bengal, there are no detailed tables on the age distribution of the total population. The only age table based on the whole material published there showed the population classified into two broad age-groups, namely, those who have not yet attained the age of 21 and those who are 21 years of age and over. Another set of tables (based on the 2% sample) gave greater details in the form of distributions as found within the sample. The 2% slips, unfortunately, were not extracted everywhere strictly according to instructions; in certain areas more, in certain others less than 2% were taken out; and there were other deviations from the procedure of drawing out every fiftieth slip. The age-distribution within the Y-sample does not therefore directly give the age characteristics of the total population. In the process of reconstruction, adjustments were made, as far as possible

on available evidence, to make allowances for deviations in the procedure of extracting every fiftieth slip, so that the appended tables show the distributions of the total population.

One other point requires to be mentioned. After a good deal of progress had been made with the punching of Hollerith cards but before tabulations began, the Province of Bengal was partitioned (on 15 August 1947). In the stage of reconstruction of the tables, necessary adjustments were therefore made as far as possible on available evidence, for the territorial changes made at the time of the partition. The present tables thus refer, to the extent possible on the reconstructed and adjusted basis, to the portion of old Bengal now called West Bengal (see Appendix) assigned under the Radcliffe Award to the newly created Dominion of India.

Definitions of groups and categories were kept the same as in the standard Census Tables with certain variations which are noted below.

## 2. EXPLANATION OF THE TABLES PRESENTED

The first set of tables shows the age-distribution of each sex for the three civil conditions 'unmarried', 'married' and 'widowed'. In West Bengal, as also presumably elsewhere in India, the number of divorced persons is very small, and in our tables this has been included in the 'widowed' group. Ages are shown by quinquennial groups upto 70, with additional figures for the groups 0-1, 1-2, 2-3, 3-4 and 4-5. Separate tables are provided for the different districts and the whole of West Bengal.

The second set shows the age distributions of each sex classified under the categories 'illiterates', 'literate' and 'literate in English'. In 1931 all children under 5 were shown as illiterates, and to secure uniformity the same procedure had been adopted in the present tables also.

The last set presents the basic material for a study of the age-distribution. These tables show the distribution of the total male and female populations by their age last

birthday. Indian age returns, as is well-known, are vitiated by mis statement of age owing mainly to the ignorance of the people in general regarding their correct age. No attempt has been made in these tables to eliminate the resulting bias in favour of certain ages. In case of the previous two sets of tables such bias, however, was eliminated to an appreciable extent by forming certain auxiliary age-groups before transforming them to those actually presented. The method employed was in the main that recommended by Mr. Vaidyanathan in his Actuarial Report on the Census of 1931.

3. METHOD OF ESTIMATION

The manner in which the distribution of the total population was estimated from the information provided by the Y-sample is explained below.

No uniform method of estimation can be used for all the districts for two reasons. Firstly, owing largely to conditions created by the war, the 2% slips were not always properly extracted, and sometimes not properly stored after extraction and were partly destroyed or lost. In consequence, available district samples were defective, some of them being extremely so. Adjustments had therefore to be made to eliminate as far as possible the effects of such defects. To make such adjustments use was made of the information relating to the distribution by communities of each sex as given in the Census tables. Fortunately the categories used in the present reconstruction, namely, 'civil condition', 'literacy' and 'age-distribution' are all closely related to the two factors, sex and community.

In the creation of the new provinces of West and East Bengal, some districts had to be partitioned. In such cases estimate for any split portion included in West Bengal had to be based either on the information for the split portion supplied by the Y-slips and the 1941 Census figures as for undivided districts also, or on the information for the whole district supplied by Y-slips and for the split portion supplied by 1941 Census figures. The second alternative had to be adopted for certain districts for the following reason. In the original enumeration slips, entries were made in a coded form to indicate census units, district, sub-division, charge etc. Unfortunately key records identifying the codes of some of the units smaller than sub-divisions with actual geographical areas were lost or could not be traced. In consequence there were cases where the slips belonging to West Bengal could not be distinguished from the remaining portion.

In certain cases even tolerably satisfactory sample slips were not available. Adjustments had to be made therefore on the basis of the information contained in the Sample Tables already published in the Census Report.

On the basis of the adjustments noted above, 'weights' or 'multipliers' were determined to estimate from sample figures results for the whole population. The figures given in these tables are such estimates. This has led to certain numerical inconsistencies in the three sets of tables. In each table, the estimation (by multiplication) was done at different points, and the results were naturally rounded off to the nearest whole number. The cumulative effect of such rounding off was not uniform in the three sets of tables, which led to apparent (but entirely negligible) numerical inconsistencies.

I. TABLES SHOWING DISTRIBUTION OF POPULATION BY AGE AND CIVIL CONDITION.

Tables for the province of West Bengal and for each individual District are given.

The figures shown in these tables are estimated from the information provided by the Y=Sample.

Divorced persons are included among the Widowed group.

The total number of divorced persons by sex in each age group is shown below.

Age Group	Divorced		
	Total	Male	Female
5—10 . . . . .	212	..	212
10—15 . . . . .	2,241	70	2,171
15—20 . . . . .	6,682	808	5,874
20—25 . . . . .	7,787	2,678	5,109
25—30 . . . . .	7,703	3,198	4,505
30—35 . . . . .	6,767	3,280	3,487
35—40 . . . . .	4,416	2,394	2,022

# WEST BENGAL

## II. TABLES SHOWING DISTRIBUTION OF POPULATION BY AGE AND LITERACY—

Tables for the Province of West Bengal and for each individual District are given.

The figures shown in these Tables are estimated from the information provided by the Y-Sample.

1931 Census practice of showing as illiterates all individuals in the age group 0-5, even though some of them have been returned as literates is maintained in these Tables.

### II. AGE AND LITERACY.

(Figures in thousands)

Age	Population			Illiterate			Literate			Literate in English

# III, TABLES SHOWING DISTRIBUTION OF POPULATION BY

## AGE LAST BIRTHDAY—WEST BENGAL

Tables for the Province of West Bengal and each individual District are given.

The figures shown in these Tables are estimated from the information provided by the Y. Sample

Figures noted against any age are the number of individuals returning their ages as such. In other words no correction has been made for mis-statement of age.

(Figures in thousands)
